How to open up a Jupyter notebook (anaconda)

1. Open up Anaconda prompt

2. Activate your environment

```
activate my_environment
```

Change to the directory that holds the notebook

```
cd /d directory/where/data/is
#  ~ or ~
cd directory/where/data/is
```

3. Activate Jupyter notebook

```
jupyter notebook
```

4. This will open a browser showing the directory you are in - click on the notebook (file extension: .ipynb) you want to open (e.g. Pandas.ipynb)

Note that the notebook *speaks* to the python environment you have activated. If the notebook uses packages that are not within your environment, you'll need to install them.
